Application for a Junior Front-End Developer position

Dear Hiring Manager,

My route into web development has not been a straight one. I have worked in technical support, customer service and warehouse roles, and have now completed my first year of front-end development at Noroff. I am now looking for an opportunity to use my skills and learn from experienced developers.

For years, confusing navigation and unnecessary steps on websites have frustrated me. This helped spark my interest in front-end development. I want to build websites that make everyday tasks easier.

I mainly work with HTML, CSS and JavaScript, using Git and GitHub for my projects. I also completed one year of back-end studies, gaining experience with databases, APIs and server-side programming. My recent project, TING, is an online shop I designed and developed myself, with a product carousel, shopping cart and product information fetched from an API.

Ay MobiCom, I worked with SQL and configured POS screen layouts, connecting images, buttons and prices. This gave me practical experience with interfaces that staff needed to use quickly and easily.

I also provided on-site support at most of Brann's home football matches in Bergen. When a POS system failed, I had to find and fix the problem quickly. This taught me to stay calm under pressure and focus on getting things working again.

I am still early in my development career, but I bring technical experience and a willingness to learn. I would like to contribute to a team where I can ask questions, share ideas and improve my skills.

Thank you for considering my application. My CV and portfolio show more of my background and work. I would be happy to discuss an opportunity further.

Kind regards,
Tommy Aarstein
